ČESKÉ VYSOKÉ UČENÍ TECHNICKÉ V PRAZE

Fakulta elektrotechnická – Katedra elektromagnetického pole

B2MPROJ6 – DIPLOMOVÁ PRÁCE

Elektronika a komunikace - Radiové komunikace a systémy

Student: **Tomáš Macháček**

Název projektu: **Towards a Faster FFT-Accelerated Full-Wave Solver and Its Integration into Shape Optimization Strategies**

Pokyny pro vypracování:

This thesis is a direct continuation of the work done in the bachelor thesis. We will propose a faster application of the impedance matrix based on the fast Fourier transform (FFT) that exploits the symmetries of the circulant embedding. This not only speeds up the computation by 50 percent in theory but also reduces the memory usage. We will further propose a memory-lean variant that is even more memory efficient and allows us to solve problems with four times as many unknowns as before. We will also propose a more powerful preconditioner based on the discrete sine and cosine transforms, which diagonalize the discrete curl and divergence operators on the rectangular grid. This allows the preconditioner to compensate for the opposite differential orders of the vector and scalar potential operators. To maintain the accuracy of the solver at very low frequencies, we will solve the system in an explicit loop/star basis in which the scalar potential acts only on the charges. Since the discrete sine and cosine transforms can be computed via the FFT, the preconditioner can be applied in $\mathcal{O}(N \log N)$ time with $\mathcal{O}(N)$ memory, so the solver retains its original complexity. The performance of the preconditioner will be tested on the eigenvalue problem of the characteristic mode decomposition, which places high demands on its quality, and its strengths will be discussed. The second part of the thesis addresses the application of the solver to the optimization of end-fire arrays, where we will take advantage of the matrix structure to accelerate the selection of the optimal candidates.
